

Olympia System Standby Power Requirement and Solutions

Olympia had a early discussion of system standby power requirement and solution in CP0. PIE team conducted this point to system Idle power measurement test which is normally tested by compliance team. PIE team still need to do LPS test for Olympia that is the SHOULD function for Olympia.

- 1. Olympia system standby power required by ' EU Commision Regulation 2023:826.pdf ' which describe non-HiNA product (O1/O2/Olympia) needs to be <2W in power standby mode.
- 2. According to Lasso's test results, the system standby power is about 4.5W which meets HiNA(Soundbar: Lasso/Gambit) requirement 8W (7W @2027). O1 & O2 are very close to 2W with using Wifi mode. [Power Consumption Sonos products](#)
- 3. Olympia has more amplifiers and 2 Gemini woofers which requires more idling power if system makes Gemini as standby mode. The tradeoff is less standby power means more TTM. After discussion with SW and UX team, Team made decision to choose Option2(Land Gemini + X2 wireless standby mode) to achieve 2W EU regulation requirements.

- 4. 2W for Olympia is a very critical challenge. This came up during our meeting with UX. Let's say for technical reasons that we simply can't achieve <2W **network standby** on Olympia *even with* the woofers landed, but we can achieve it in **sleep** (SoC suspend) state.

In that case, we would need to pivot to not only enable sleep by default, but add a customer setting in the app so they can turn it off at the cost of higher idle power.

- 5. Considering all above information, PIE still need to test LPS for validating SOC suspend function in system as a backoff solution.
